

Reproducible Manuscripts in R Markdown

Juli Tkotz

27-05-2020

ZI Mannheim, RG Psychology and Neurobiology of Sleep and Memory

What is a reproducible manuscript?

- A manuscript that directly embeds your **research data** and **analysis code**.
- Any person with the raw data can run the code and **reproduce** your manuscript.
- Interactive stand-alone versions are possible.

263 3.1 Epistemic Trustworthiness

264 Participants placed more epistemic trust in the debaters when reading a neutral debate: Student
265 teachers in the neutral condition ($M = 5.06, SD = 1.00$) perceived the debaters to have more expertise
266 than those in the uncivil condition ($M = 5.06, SD = 1.00$), $t(218.49) = 1.99, p = .047, d = 0.27$.
267 Furthermore, participants reading a neutral debate ($M = 4.76, SD = 1.02$) reported higher ratings of
268 debaters' integrity than those reading an uncivil debate ($M = 4.05, SD = 1.15$), $t(219.41) = 4.87, p < .001, d = 0.65$. Additionally, ratings of benevolence were higher in the neutral condition ($M = 4.77, SD = 0.98$) than in the uncivil condition ($M = 4.05, SD = 0.89$), $t(214.11) = 5.67, p < .001, d = 0.76$ (see Figure 2).

272 We further explored the correlation between the conflict explanation items and the METI subscales,
273 that is, if the perception of various aspects of a conflict was associated with different degrees of
274 epistemic trust. Those who agreed that the debaters in the scenario referred to different research
275 results also thought them to have more expertise, $r(220) = .14, p = .039$. There was no relation with
276 integrity, $r(220) = .07, p = .321$, or benevolence, $r(220) = .03, p = .679$. Assuming personal reasons
277 for the conflict had the strongest relationship with epistemic trust. The more participants perceived
278 the conflict to be personal, the less expertise they assigned to the debaters $r(220) = -.25, p < .001$. In
279 a similar manner, perception of a personal conflict lead to decreased ratings of integrity, $r(220) =$
280 $-.36, p < .001$, and benevolence, $r(220) = -.41, p < .001$. How much participants agreed that the
281 debaters referred to different goals of PAVLOV did not correlate with any of the METI subscales,
282 neither with expertise, $r(220) = .10, p = .122$, nor with integrity, $r(220) = -.00, p = .946$, nor with
283 benevolence $r(220) = -.00, p = .994$. Embracement of the statement that debaters referred to different
284 effects of PAVLOV was not associated with epistemic trust either, neither with expertise, $r(220) =$
285 $.01, p = .863$, nor with integrity, $r(220) = -.06, p = .348$, nor with benevolence $r(220) = -.05, p =$
286 $.475$. Internal consistency of the METI subscales was somewhat lower than initially found by
287 Hendriks et al. (2015), with a Cronbach's α of .87 for expertise, .83 for integrity and .76 for
288 benevolence.

R Markdown to the rescue

```
## R Markdown to the rescue
```

```
```{r intext_stats, echo = TRUE}  
nerd <- read.csv("./data/nerd.csv", sep = "\t")
```
```

```
```{r copy_paste_hell}  
include_graphics("./pics/slide_inception.png")
```
```

This example dataset consists of $N = \text{r nrow(nerd)}$ participants with an age range between $\text{r min(nerd[["age"]])}$ and $\text{r max(nerd[["age"]])}$ years. Overall, $\text{r sum(nerd$age > 100)}$ participants reported to be older than 100, so we probably can't trust this data set a lot.

This example dataset consists of $N = 14955$ participants with an age range between 13 and 38822 years. Overall, 8 participants reported to be older than 100, so we probably can't trust this data set a lot.

Data retrieved from <https://openpsychometrics.org/>

R Markdown to the rescue

```
## R Markdown to the rescue
```

```
```{r intext_stats, echo = TRUE}  
nerd <- read.csv("./data/nerd.csv", sep = "\t")
```
```

```
```{r copy_paste_hell}  
include_graphics("./pics/slide_inception.png")
```
```

This example dataset consists of $N = \texttt{r nrow(nerd)}$ participants with an age range between $\texttt{r min(nerd[["age"]])}$ and $\texttt{r max(nerd[["age"]])}$ years. Overall, $\texttt{r sum(nerd$age > 100)}$ participants reported to be older than 100, so we probably can't trust this data set a lot.

This example dataset consists of $N = \mathbf{14955}$ participants with an age range between $\mathbf{13}$ and $\mathbf{38822}$ years. Overall, $\mathbf{8}$ participants reported to be older than 100, so we probably can't trust this data set a lot.

How about some stats?

```
nerd_ttest <- t.test(sum_score ~ gender, data = nerd)
nerd_effsize <- cohen.d(sum_score ~ gender, data = nerd)
```

```
In this dataset, men `r print_mean_sd(nerd[["sum_score"]][nerd[["gender"]] == "male")` have a
significantly lower nerd score than women `r print_mean_sd(nerd[["sum_score"]][nerd[["gender"]]
== "female")`, `r print_ttest(nerd_ttest, nerd_effsize)`.
```

In this dataset, men ($M = 95.18$, $SD = 15.27$) have a significantly lower nerd score than women ($M = 95.82$, $SD = 15.16$), $t(9800.06) = -2.39$, $p = .017$, $d = -0.04$.

Yeah, plots!

Yeah, references!

```
## Yeah, references!  
  
```{r citation}  
include_graphics("../pics/citation.png")
```  
  
If I want to cite a paper, I can do this [san_martin_1968].  
This also works if I cite @san_martin_1968 as an in-text citation.
```

If I want to cite a paper, I can do this (San-Martin et al. 1968).
This also works if I cite San-Martin et al. (1968) as an in-text
citation.

How to get bibtex references

The screenshot shows a journal article page for "ASPECTS OF REPRODUCTION IN THE ALPACA" in the journal "Reproduction". The article is by M. SAN-MARTIN, M. COPAIRA, J. ZUNIGA, and R. RODRIGUEZ. The DOI is <https://doi.org/10.1530/jrf.0.0160395>. The article type is "Research Article" and the online publication date is May 20, 2020. The volume and issue are 16, Issue 3. The page number is 395-399. The article is available for free access.

The "Preview Citation" modal is open, showing the citation in APA format:
SAN-MARTIN, M., COPAIRA, M., ZUNIGA, J., RODRIGUEZ, R., BUSTINZA, G., & ACOSTA, L. (1968). ASPECTS OF REPRODUCTION IN THE ALPACA, *Reproduction*, 16(3), 395-399. Retrieved May 20, 2020, from https://repo.bioscientifica.com/view/journals/rep/16/3/jrf_16_3_009.xml

The "Export Citation" section shows three options:
- ris (ProCite, RefWorks, Reference Manager)
- bib (BibTeX, Zotero)
- enw (EndNote)

A red arrow points to the "bib" button, indicating the correct choice for BibTeX references.

Fully formatted articles

The R-packaga papaja offers you documents that are formatted according to APA (6) style.

Talking about reproducibility ...

```
> anticlusters <- anticlust::anticlustering(  
+   iris[, -5],  
+   K = 3,  
+   objective = "variance",  
+   method = "exchange"  
+ )  
Error in loadNamespace(name) : there is no package called 'anticlust'
```
